To Whom It May Concern:

I have been using Theralac for sixth months both personally and with patients and family. During this time Theralac's acid proof coating and potency of twenty billion organisms has demonstrated remarkable clinical results. My son has suffered for years with *dientameba fragilis*, during which time we have tried both naturopathic and conventional therapies with limited success. After introducing Theralac in conjunction with other pre-existing therapies his bowel function has normalized. In addition, I have a long history of personally using probiotics, and Theralac is the first to noticeably affect my bowel function by eliminating constipation and normalizing stool diameter. In switching from a high quality human microflora product to Theralac there has been a clear difference in both objective and subjective markers favoring its use.

Recent research supports the use of acid proof coatings and with Theralac containing more organisms than any other product available it stands out as the clear choice. The result is a greater amount of healthy bacteria colonizing the lower gastrointestinal tract and an unsurpassed clinical response.

It is without hesitation that I can strongly recommend using Theralac as a superior probiotic formulation.

Sincerely,
